Mikhail Lukin,
QuEra Computing Inc.
1380 Soldiers Field Road
Boston, MA 02135

Subject: Inquiry About PhD Research Fit in Quantum Computing

Dear Professor Lukin,

I am writing to express my interest in the Harvard Quantum Initiative PhD program in Quantum Science and Engineering. My research on Glidecart, a Qiskit compatible quantum optimization platform, and applies quantum algorithms to grocery logistics. Furthermore, Glidecart's roadmap for photonic integration aligns with your work in quantum optics and scalable quantum systems.

Glidecart currently optimizes grocery logistics using gate-based quantum systems, and achieve measurable improvements—20% faster delivery scheduling compared to classical methods. However, as computational demands grow, photonic quantum computing for scalability and energy efficiency appears transformation. In addition, your research on optical qubits and fault-tolerant architectures remains foundational for future research.

COLLABORATION GOALS:

At HQI, I plan to work with your group to:

- **Optical Qubits for Applied Optimization:** Use Glidecart as a tool to evaluate photonic architectures in grocery shopping scenarios and generate empirical data on speed, error rates, and energy consumption.
- **Develop Photonic-Compatible Algorithms:** Adapt combinatorial optimization algorithms for optical qubit systems and ensure fault-tolerant performance at scale.
- **Explore Hybrid Photonic-Classical Workflows:** Combine classical preprocessing with photonic quantum execution to address NISQ limitations and maximize throughput.
- **Advance Sustainable Quantum Computing:** Discover large-scale algorithms for strategies that align with global sustainability, and include energy-efficient approaches.

This collaboration integrates theory with Glidecart's application. Subsequently, leverages quantum advantage in grocery and advance scalable architectures for research.

Sincerely,

Anél Henning

Anél Henning

Boaz Barak,
Harvard Quantum Initiative,
1380 Soldiers Field Road,
Boston, MA 02135

Subject: Inquiry About PhD Research Fit in Quantum Computing

Dear Professor Barak,

I am writing to express my interest in the Harvard Quantum Initiative **PhD program** in Quantum Science and Engineering. My research on Glidecart, Qiskit-compatible quantum optimization platform, and apply quantum algorithms in grocery logistics. Glidecart focuses on combinatorial optimization and algorithmic efficiency, and intersect with your work: **computational complexity** and **quantum algorithm design.**

Glidecart optimizes retail logistics with gate-based quantum systems, and achieve measurable improvements—20% faster delivery scheduling versus classical methods. However, the problem sizes grows, and challenge design algorithms to balance scalability, fault tolerance, and resource efficiency as critical. Your research on complexity theory and limits of quantum computation provides a rigorous foundation to address challenges

COLLABORATION GOALS:

At HQI, I plan to work with your group to:

- **Algorithmic Complexity for Quantum Optimization:** Analyze theoretical limits of Glidecart's optimization algorithms and explore complex classes in advancement of groceries in quantum computing.
- **Design Scalable Quantum Algorithms:** Adapt combinatorial optimization algorithms to minimize depth and error rates under NISQ constraints, and ensure performance at scale.
- **Hybrid Quantum-Classical Frameworks:** Combine workflows with classical preprocessing quantum execution and optimize resource allocation throughput.
- **Foundations for Sustainable Quantum Computing:** Investigate algorithmic strategies to reduce computational overhead and align energy-efficient paradigms.

  The collaboration bridges theory and application, and leverages rigorous complexity analysis. Thereby, guide quantum optimization in groceries stores.

Sincerely,

Anél Henning

Anél Henning

Anurag Anshu,
Harvard Quantum Initiative,
1380 Soldiers Field Road,
Boston, MA 02135

Subject: Inquiry About PhD Research Fit in Quantum Computing

Dear Professor Anshu,

I am excited to apply to the Harvard Quantum Initiative PhD program in Quantum Science and Engineering. In addition, Glidecart, quantum optimization platform for groceries logistics, and content-aware quantum algorithm mixed theory and application. Glidecart employs **hybrid quantum-classical** workflows to address **NISQ limitations.** Thereby, Glidecart perform under noisy conditions and is similar to your **quantum complexit**y and **error resilience.**

COLLABORATION GOALS:

At HQI, I envision working with your group too:

- **Formalize Complexity-Theoretic Guarantees:** Optimize algorithms under rigorous bounds and NISQ constraints, thereby predict performance in noisy environments.
- **Adaptive Error-Mitigation Strategies:** Improve probabilistic complex techniques for algorithmic stability and scalability.
- **Benchmark Algorithms on Real-World Workloads:** Use Glidecart as a tool to build algorithms in grocery industry.
- **Advance Hybrid Workflow Research:** Investigate trade-offs between classical preprocessing and quantum execution, optimizing resource allocation for complex combinatorial problems.

Thes goals integrate theoretical with practical validation, and contribute to HQI's mission of crossdisciplinary innovation in quantum science.

My portfolio, includes several products in quantum computing and Python-based charts for several quantum products. However, Glidecart, demo performance improvements such as 20% time savings through Qiskit-based implementations. Ultimately, I want to collaborate with complexity-aware quantum algorithms and deliver benefits to grocery industries.

Thank you for considering my application. I hope I can work with you and HQI's faculty to push boundaries of quantum complexity research.

Sincerely,

Anél Henning

William D. Oliver,
MIT EECS Department,
77 Massachusetts Avenue,
Cambridge, MA 02139,
Room 38-401

Subject: Inquiry About PhD Research Fit in Quantum Computing

Dear Professor Oliver,

I write to express my interest in the **MIT Quantum Engineering PhD program** and collaborate with your group. My research centers on **Glidecart**, Qiskit-based autonomous shopping and delivery vehicle with quantum algorithms for grocery logistics. Moreover, **Glidecart** focus on measurable metrics—20% faster scheduling versus classical methods. Thereby, I enable Qiskit-based components in my research. As quantum computing advances, I use complexity-aware quantum algorithms under NISQ constraints. Thus, Glidecart remains robust and scalable. Professor Oliver's research: **quantum engineering, error mitigation**, and **scalable architectures** as it aligns with my goals.

COLLABORATION GOALS:

At MIT, I envision working with your group to:

- **Formalize Complexity-Theoretic Guarantees:** Optimize algorithms constrained by formal proven math limits and NISQ constraints. Thereby, I can predict performance in noisy environments.
- **Adaptive Error-Mitigation:** Improve probabilistic and complexity-based techniques for algorithmic stability and scalability.
- **Algorithms benchmark Groceries Workloads:** Use Glidecart as a tool to validate quantum optimization in groceries.
- **Advance Hybrid Workflow:** Investigate trade-offs between classical preprocessing and quantum execution to optimize resource allocation for complex combinatorial problems.

My goals integrate theory with practical validation, thereby contributes to MIT's mission of cross-disciplinary innovation in quantum science. My portfolio includes **several quantum computing products** with Python-based visualization tools. Finally, Glidecart remains tangible example of performance gains. Ultimately, I believe to collaborate on complexity-aware quantum algorithms because it will deliver real-world benefits to advance foundational research.

Thank you for considersideration. I believe to collaborate with you and MIT's faculty can push the boundaries of quantum complexity and engineering.

Sincerely,

Anél Henning

Dr. Rob Schoelkopf,
Yale University
Department of Applied Physics
P.O. Box 208284
New Haven, CT 06520-8284

Subject: The Relevance of Dr. Rob Schoelkopf's Research to GlideCart Development

Dear Professor Schoelkopf,

I am interestex in collaborating with you in quantum information science, and focus on application to advance autonomous vehicles. Specifically, my GlideCart, autonomous shopping and delivery car designed to optimize efficiency within grocery industry. Not to mention, I plan to add principles of quantum computing framework for GlideCart. Specifically, I can advance decision-making, allocation of resources, and scalability in grocery indsutry.

As Sterling Professor of Applied Physics and Physics at Yale University and Director of the Yale Quantum Institute, you are known for **circuit quantum electrodynamics** and **superconducting qubits** and **quantum error correction.** Your focus on scalable quantum systems and high-performance devices is essential for next-generation computing.

GlideCart currently uses classical algorithms but it is limited hardware for vision tracking and item recognition. Thereby, it adds quantum principles: **error correction** and **modular architectures** and builds a faster, accurate and scalable autonomous vehicle called GlideCart.

Futhermore, professor Schoelkopf, research aligns with GlideCart's future goals: **full-store navigation** and **inventory mapping.** Thereby, quantum-inspired algorithms reduce delays in pathfinding and obstacle avoidance, and Glidecart remains responsive with mobility challenges.

I welcome the opportunity to discuss possible collaborations that combine quantum computing concepts with assistive robotics.

Thank you for your time and consideration.

Please contact **anel_henning@icloud.com** or **813-743-1661.**

Sincerely,

Anél Henning

David Awschalom,
University of Maryland
4150 Campus Drive,
College Park, MD 20742

Subject: Exploring Collaboration on Quantum Information Science for Autonomous Retail Systems
Dear Professor Awschalom.

Dear Professor Awschalom,

I am writing about an opportunity to collaborate with you in quantum information science, and advance development of my product called **GlideCart**. An autonomous shopping and delivery vehicle designed to be efficient and accessible within grocery industry.

Your pioneering work in quantum spintronics, quantum sensing, and quantum communication taught me how quantum states of matter can engineer and control practical applications. As the Liew Family Professor of Molecular Engineering and Director of the Chicago Quantum Exchange, your research on electron and nuclear spins manipulating in semiconductors and molecules opens pathways. Specifically, scalable quantum architectures and high-performance quantum devices. Ultimately, I can see how your innovations build foundation for next-generation sensing technologies.

Next, GlideCart is efficienct compute with quantum technologies because it can consistently optimize. The future of autonomous grocery vehicles rely on how classical algorithms runs on constrained hardware: vision-based tracking and real-time decision-making. Not to mention, quantum principles: error correction, spin-based qubits, and quantum sensing which enables fast processing. In addition, it improves object recognition, enhanced autonomy, in dynamic grocery store. Ultimately, Professors Awschalom's quantum coherence and nanoscale sensing helps with inventory mapping in environmental awareness. Thus, GlideCart remains responsive and reliable for users.

In summary, I believe your expertise in quantum information science solves my challenges of autonomous retail systems and I can produce functional robot. Thus, I look forward to discuss any collaboration in quantum engineering principles, assistive robotics and AI-driven logistics.

Thank you for consideration. Please feel free to contact me at anel_henning@icloud.com or 813-743-1661 for further discussion.

Sincerely,

Anél Henning

Matt Johnson,
Stanford Q-FARM Initiative,
476 Lomita Mall,
Stanford, CA 94305

Subject: Leveraging Quantum Research for Autonomous Retail Innovation

Dear Professor Johnson,

I am writing to express my interest in collaborating between Stanford Q-FARM Initiative and development of my project, GlideCart. An autonomous shopping and delivery platform designed to enhance operational efficiency and accessibility in the grocery industry.

Your research at Q-FARM, quantum fundamentals, architectures, and scalable quantum systems can advance GlideCart's classical computing limitations. Specifically, with Professor's Johnson work on quantum algorithms and optimization of frameworks for decision-making models. Thereby, Glidecart can run in real-time navigation and in inventory management. Consequently, the capabilities are designed for computational complexity in dynamic grocery store.
For example, rapid pathfinding and resource allocation remains crucial.

Furthermore, Q-FARM's integrates quantum sensing, photonic technologies, and aligns with GlideCart long-term vision of high-precision environmental awareness systems. Futhermore, quantum-enhanced sensing improves my object recognition and obstacle detection. As a result, GlideCart operate with autonomy and reliability. Subsequently, quantum theory robotics application runs with quantum technology before it becomes consumer-facing systems.

The Stanford Q-FARM Initiative remains a global leader in quantum research. Specifically, in breakthroughs with quantum computing architectures, error correction, and photonic systems. The cross-discipline connect physics, engineering, and computer science because they enable Proffesor Johnson's pioneering work on scalable quantum devices and algorithms in groceries. Thereby, Q-FARM as ideal partner for quantum innovations especially autonomous retail systems, efficiency and adaptability.

Ultimately, I welcome the opportunity to discuss how your research can advance collaborative projects and unite quantum engineering principles with autonomous grocery vehicles. Please feel free to contact me at anel_henning@icloud.com or 813-743-1661.

Thank you for your time and consideration.

Sincerely,

Anél Henning

Subject: Explore Quantum-Driven Innovation for Autonomous Retail Systems

Dear Dr. Shadbolt,

I am writing to express my interest in collaboration with PsiQuantum and discuss how Dr. Shadbolt's pioneering work in photonic quantum computing can accelerate groceries. My project, Glidecart, autonomous shopping and delivery vehicle for grocery store can enhance shopping efficiency and accessibility.

Your leadership in scalable photonic quantum architectures positions **PsiQuantum** as a leader in quantum hardware. Thereby, my Glidecart, can go beyond traditional computing. Futhermore, **Glidecart** unfortunately relies on classical algorithms for vision-based navigation, inventory mapping, and real-time decision-making. Namely, complex tasks in dynamic grocery environments. Quantum algorithms can optimize for high-performance architectures and autonomous vehicles. For example: deliver computational speed, reduction latency, and adaptive routing. Ultimately, Glidecart, responds daily as robust autonomous shopping and delivering car.

Moreover, PsiQuantum's emphasis on semiconductor for large-scale quantum aligns with GlideCart's vision. For example: integrate advanced computational before consumer-facing technologies. Subsequently, Glidecart demo everyday quantum engineering principles with autonomous robotics quantum computing.

To conclude, I look forward to discuss potential collaboration in photonic quantum hardware of autonomous grocery delivery and shopping vehicles.

Please feel free to contact me at anel_henning@icloud.com and 813.743.1661.

Thank you for your time and consideration.

Sincerely,

Chris Monroe,
IonQ,
4505 Campus Drive,
College Park, MD 20740

Subject: Exploring Quantum Collaboration for Autonomous Retail Innovation

Dear Dr. Monroe,

I am writing to ask if I can collaborate with IonQ and your pioneering work at **IonQ: trapped-ion quantum computing.** Thereby, I can advance **GlideCart**, an autonomous shopping and delivery vehicle with efficiency and accessibility for user experience at groceries.

Dr. Monroe's leadership in development of scalable, high-fidelity quantum hardware and algorithms directly aligns with GlideCart's vision. Specifically, **next-generation supply chain** optimizes such that Glidecart can run in **real-time decision-making.** Consequently, it still relies on classical algorithms for navigation, inventory mapping, and route optimization tasks. Thus, it becomes complex in dynamic shopping in groceries. Conversely, quantum algorithms, Quantum Approximate Optimization Algorithm (QAOA) and Quantum Support Vector Machines (QSVM), increases computational speed, threat detection and resource allocation. To conclude, IonQ's robust hardware can enhance Glidecart's autonomous retail systems as adaptive and secure.

To conclude, Dr. Monroe's commitment to collaborate cross-discipline continues to advances error correction and noise resilience. Not to mention, he ensured quantum-powered solutions as reliable and suitable for deployments especially for groceries. Futhermore, GlideCart's human-centered design ensures all grocery stores can prioritizes tasks called accessibility, usability, and inclusivity as pilot deployments.

Ultimately, I welcome an opportunity to discuss collaboration with Dr. Monroe's expertise in quantum information science and fix challenges of autonomous delivery and shopping vehicles.

Thank you for your time and consideration.

Sincerely,

Subject: Quantum Collaboration for Autonomous Retail Innovation

Dear Professor Childs,

I am inquiring about collaborating with you at UMIACS on my project, Glidecart. Specifically, your research in quantum algorithms and complexity theory. Next, your instrumental work shapes foundations for Glidecart, thereby I can build quantum optimization for grocery logistics.

At Glidecart, I developed Qiskit-compatible algorithms to optimize delivery schedules, and achieve a 20% improvement over classical heuristics. Futhermore, your research advance principles of quantum algorithm design and error mitigation strategies. Specifically, your contributions in quantum complexity have guided Glidecart to hybrid quantum-classical workflows. Thereby, you enabled us to scale solutions correct for NISQ devices.

Not to mention, your rigorous algorithmic frameworks resonates with Glidecart mission to integrate quantum-safe cryptographic protocols: secure supply chain transactions. Following performance assessments on IBM Quantum hardware, I can demo practical viability of Glidecart rooted in your academic work.

I would welcome the opportunity to collaborate with your work on quantum computing accelerate innovation in this space.

Thank you for your invaluable contributions to the field. Please contact me at 813.743.1661 and anel_henning@icloud.com.

Sincerely,
